

# DATA SHEET

## DATAFLOW MANAGER

### A First-in-Class Technology

Dataflow Manager is the industry's first Study Management System founded on Cloud Computing. Built as a scalable SaaS solution, it delivers on-demand business intelligence to drive decisions in-stream. Using operational analytics to track and predict study performance, Dataflow Manager provides instant visibility into the state of a clinical trial, enabling proactive study management and study team collaboration.

Dataflow Manager is the first commercially available product of its kind in the life sciences industry.

### Proactive Study Management

Dataflow Manager provides an unparalleled set of capabilities for proactively managing clinical trials. It transforms the process of managing studies through automation and the use of in-stream operational analytics to manage sites, track subjects, optimize workflow, and provide dynamic reporting on study performance. Using the concept of data expectedness, Dataflow Manager

enables study teams to quickly identify bottlenecks and resolve critical issues in-stream.

### **Team Collaboration**

With the ability to view this information through one central interface, Dataflow Manager decreases the need for emails, study team meetings and phone calls in order to understand trial progress. With everyone looking at the same data, and trial metrics, study teams are able to focus on collaboratively progressing the study.

### **Study and Program Level Performance**

Dataflow Manager studies can be rolled up into program level views to compare study performance within a program, investigator performance across studies, and provide metrics on trends and milestones.

### **Flexible, Scalable, Cost Effective**

Dataflow Manager provides flexible options for organizations of all sizes. With targeted solution models, it provides scalable options to meet the needs of all technology landscapes, resource teams, and study designs. Delivered through a SaaS model, it is cost effective for 1 study or 100.
